

Part 2 - Elements Per Thread [Not to scale]

Workgroup Size = 64

Array size = 2^{22}

Each separate work-item / thread is responsible for 8 elements

Divide the array size, by EPT:

$$2^{22} / 8 = 524288 \quad (\text{\#threads/work-items})$$

How many 'chunks' are left, this value can now be divided by the WGZ

$$524288 / 64 = 8192 \quad (\text{\#work groups})$$
